

This crate contains the driver trait necessary for adding `embassy-net` support for a new hardware platform.

If you want to *use* `embassy-net` with already made drivers, you should depend on the main `embassy-net` crate, not on this crate.

If you are writing a driver, you should depend only on this crate, not on the main `embassy-net` crate.

This will allow your driver to continue working for newer `embassy-net` major versions, without needing an update, if the driver trait has not had breaking changes.

See also `embassy-net-driver-channel`, which provides a higher-level API to construct a driver that processes packets in its own background task and communicates with the `embassy-net` task via packet queues for RX and TX.
